ABSTRACTED-PUB-NO: WO 200239433A

BASIC-ABSTRACT:

NOVELTY - A magnetic recording medium having a magnetic recording layer (63) made of an ordered alloy containing boron (B) and formed on a substrate (1) containing an amorphous component. A part of the boron in the ordered alloy is segregated at the grain boundaries, and consequently the magnetic interaction between magnetic particles can be reduced. Therefore small magnetic domains can be formed in the magnetic recording layer (63) and the noise can be reduced. The substrate heating temperature when forming the magnetic recording layer (63) can be low since the ordering temperature of the ordered alloy containing B is lower than those of ordered alloys not containing B, and therefore a glass substrate suitable for mass production can be used. The heat stability of the magnetic recording layer (63) is excellent since an ordered alloy of high magnetic anisotropy is used. Thus, a high-density recording magnetic recording medium having an excellent heat stability and exhibiting low noise is realized.

USE - None given.
